The objective is to create a vertical village concept that combines commercial and residential spaces. The project aims to create a new urban fabric by utilizing the vertical space beneath existing infrastructure. The concept involves the creation of a new structure that is integrated with the existing infrastructure. The new structure will be designed to be self-sufficient in terms of energy and water management. The project will include the use of renewable energy sources such as solar and geothermal power. The new structure will also include rainwater harvesting and treatment systems to ensure that all water is reused within the village. The village will be designed to be a sustainable and healthy environment for its residents. The project will be implemented in stages, starting with the construction of the new structure and then adding additional levels of public spaces, retail, and housing as needed. The village will be connected to the existing infrastructure and will be designed to be self-sufficient in terms of energy and water management. The village will be a model for sustainable urban development and will be a showcase for the future of urban living.
